DATABASE :

"Database is a place or a medium in which we store the data in a Systematic and organized manner "

- The basic operations that can be performed on a database are
 - CREATE / INSERT
 - READ / RETRIEVE
 - UPDATE / MODIFY
 - DELETE / DROP
- These operations are referred as "**CRUD**" Operations .

DATABASE MANAGEMENT SYSTEM (DBMS) :

"It is a software which is used to maintain and manage The database "

- **Security** and **authorization** are the two important features that DBMS provides .

- We use query language to communicate or interact with DBMS
- DBMS stores the data in the form of *files* .

RELATIONAL DATABASE MANAGEMENT SYSTEM (RDBMS):

"It is a type of DBMS software in which we store the data

In the form of Tables (rows & columns) ".

- We use **SQL** to communicate or interact with **RDBMS**
- RDBMS stores the data in the form of *Tables*.

Example :

<u>Names</u>
A
B
C
D
E

DAY 2

Friday, 17 July 2020

8:59 AM

RELATIONAL MODEL :

Relational Model was designed by **E.F CODD** .

In Relational Model we can store the data in the form of *tables* .

Any DBMS which follows Relational Model becomes RDBMS .

Any DBMS which follows rules of EF CODD becomes RDBMS .

TABLE : "It is a logical organization of data which consists of Columns & Rows .

Example :

Employee : ←

<u>EID</u>	<u>ENAME</u>	<u>SALARY</u>
1	SMITH	1000
2	ALLEN	1500
3	CLARK	2000

→ Emp (Entity)

- Eid
- Ename
- Salary

RULES OF E.F CODD :

1. The data entered into a cell must always be a single valued data .

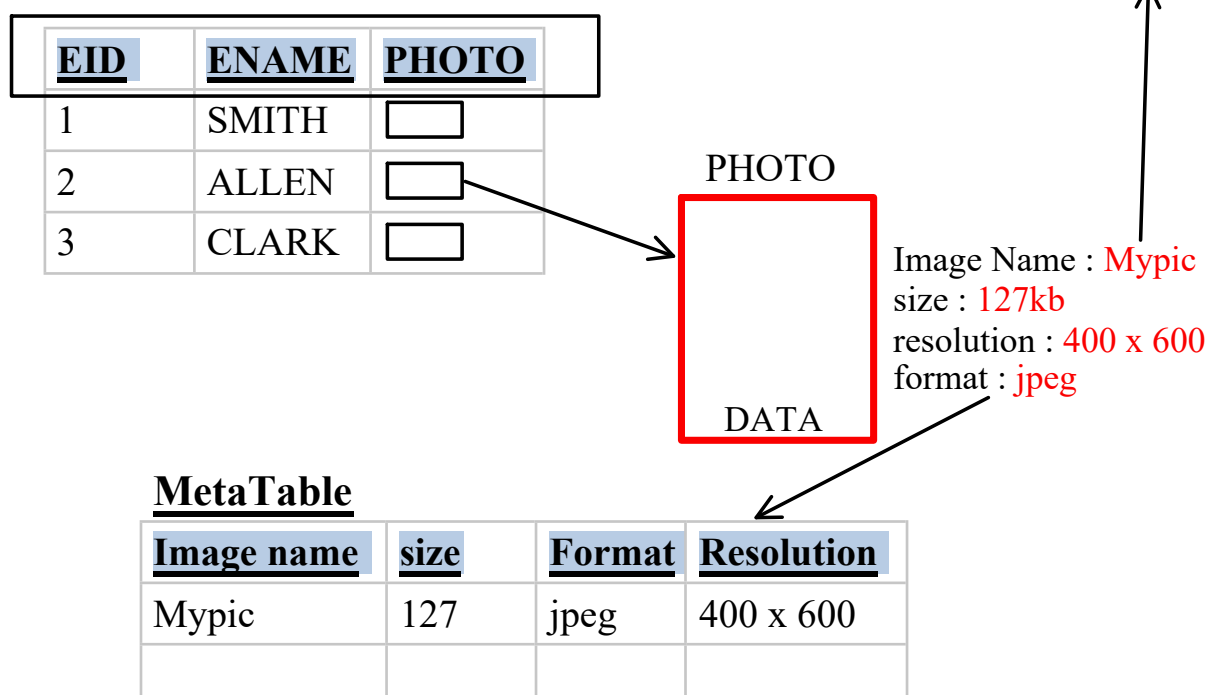

Example :

<u>EID</u>	<u>ENAME</u>	<u>PHONE NO</u>
1	SMITH	101
2	ALLEN	102 , 202
3	CLARK	103

<u>EID</u>	<u>ENAME</u>	<u>PHONE NO</u>	<u>ALTERNATE NO</u>
1	SMITH	101	
2	ALLEN	102	202
3	CLARK	103	

2. According to E.F CODD we can store the data in Multiple Tables ,
If needed we can establish a connection between the tables with the
Help of Key Attribute .
3. In RDBMS we store everything in the form of tables including
Metadata .

Example : Metadata : The details about a data is known as Metadata.

4. The data entered into the table can be validated in 2 steps .
 - i. By assigning Datatypes .
 - ii. By assigning Constraints .

Datatypes are mandatory , whereas Constraints are Optional .

DATATYPES :

*It is used to specify or determine the type of data that will be stored
In a particular memory location .*

Datatypes in SQL :

1. CHAR
2. VARCHAR / VARCHAR2
3. DATE
4. NUMBER
5. LARGE OBJECTS
 - i. Character Large Object .
 - ii. Binary Large Object .

NOTE : SQL is not a Case Sensitive Language .

1. **CHAR :** In character datatype we can store 'A-Z' , 'a-z' , '0-9'
And Special Characters(\$, & , @ , ! ...) .

- Characters must always be enclosed within single quotes ' ' .
- Whenever we use char datatype we must mention size
- **Size** : it is used to specify number of characters it can store .
 - The maximum number of characters it can store is **2000ch.**
- Char follows fixed length memory allocation .

Syntax: CHAR (SIZE)

Example : CHAR (8)

2. **VARCHAR** : In varchar datatype we can store 'A-Z' , 'a-z' , '0-9' And Special Characters(\$, & , @ , ! ...) .

- Characters must always be enclosed within single quotes ''.
- Whenever we use char datatype we must mention size
- **Size** : it is used to specify number of characters it can store .
 - The maximum number of characters it can store is **2000ch.**
- VarChar follows variable length memory allocation .

Syntax: VARCHAR (SIZE)

Example : VARCHAR (8)

NOTE : **VARCHAR2** : it is an updated version of varchar where in We can store up to **4000Ch.**

Syntax: VARCHAR2(SIZE)

Example :

STUDENT

<u>USN</u>	<u>SNAME</u>	<u>ADDRESS</u>	<u>PAN_NO</u>
CHAR(4)	VARCHAR(10)	VARCHAR(10)	CHAR(10)
QSP1	DINGA	BANGALORE	ABC123XYZ1
QSP2	DINGI	MYSORE	ABC123XYZ2

ASSIGNMENT :

1. DIFFERENTIATE BETWEEN CHAR & VARCHAR

ASCII : [American Standard Code For Information Interchange]

'A'	65
'Z'	90
'a'	97
'z'	122

3. **NUMBER** : It is used to store numeric values .

SYNTAX: NUMBER (Precision , [Scale])

[] - Not Mandatory .

Precision : it is used to determine the number of digits used To store integer value .

Scale : it is used to determine the number of digits used to store Decimal (floating) value within the precision .

- Scale is not mandatory , and the default value of scale Is zero (0) .

Example :	Number (3)	+/- 999
Example :	Number (5 , 0)	+/- 99999
Example :	Number (5 , 2)	+/- 999.99

DAY 4

Tuesday, July 21, 2020 9:34 AM

CONSTRAINTS :

It is a rule given to a column for validation .

Types of Constraints :

1. UNIQUE
2. NOT NULL
3. CHECK
4. PRIMARY KEY
5. FOREIGN KEY .

1. **UNIQUE** : *"It is used to avoid duplicate values into the column "*
2. **NOT NULL** : *"It is used to avoid Null "*
3. **CHECK** : *"It is an extra validation with a condition
If the condition is satisfied then the value is accepted else
Rejected "*
4. **PRIMARY KEY** : *"It is a constraint which is used to identify a record
Uniquely from the table " .*

Characteristics of Primary key :

- We can have only 1 PK in a table
- PK cannot accept duplicate / repeated values .
- PK cannot accept Null
- PK is always a combination of Unique and Not Null Constraint.

5. **FOREIGN KEY** : *"It is used to establish a connection between the
The tables "*

Characteristics of Foreign key :

- We can have only Multiple FK in a table
- FK can accept duplicate / repeated values .
- FK can accept Null
- FK is not a combination of Unique and Not Null Constraint.
- For an Attribute (column) to become a FK ,it is mandatory
That it must be a PK in its own table .

Example :

EMP

<u>Primary key</u>				
		Check (Salary >		Check

		0)		(length(phone) = 10)
Not Null	Not Null	Not Null	Not Null	Not Null
Unique				Unique
EID	NAME	SALARY	DOJ	PHONE
Number(2)	Varchar(10)	Number(7,2)	Date	Number(10)
1	A	10000	'20-JUN-20'	9876543210
2	B	20000	'20-JUN-19'	9876543222
3	C	35000	'01-JAN-18'	9876543333
4	D	50000	'01-OCT-19'	9876511111

Example for Foreign Key :

Emp

EID	NAME	SALARY	DNO FK	CID FK
1	A	10000	20	2
2	B	20000	10	3
3	C	35000	20	1
4	D	50000	10	2

Child Table

Customer

CID	CNAME	CNO
1	X	1001
2	Y	2002
3	Z	3003

Parent Table

Dept

DNO	DNAME	LOC
10	D1	L1
20	D2	L2

Parent Table

ASSIGNMENT :

1. Differentiate between Primary key and Foreign key .

<u>PRIMARY KEY</u>	<u>FOREIGN KEY</u>
It is used to identify a records Uniquely from the table.	It is used to establish a connection Between the tables
It cannot accept Null	It can accept Null
It cannot accept duplicate values	It can accept duplicate values
It is always a combination of Not Null and Unique constraint	It is not a combination of Not Null and Unique constraint
We can have only 1 PK in a table	We can have Multiple FK in a table

NOTE : NULL

Null Is a *keyword* which is used to represent Nothing / Empty Cell.

Characteristics of Null :

- Null doesn't represent 0 or Space .
- Any operations performed on a Null will result in Null itself

- Null doesn't Occupy any Memory .
- We cannot Equate Null .

DAY 5

Wednesday, July 22, 2020 9:02 AM

OVERVIEW OF SQL STATEMENTS :

DATA QUERY LANGUAGE (DQL) :

" DQL is used to retrieve the data from the database " .

1. SELECT
2. PROJECTION
3. SELECTION
4. JOIN

1. **SELECT** : "It is used to retrieve the *data* from the table and display it.
2. **PROJECTION** : "It is a process of retrieving the data by *selecting only the columns* is known as Projection " .
 - In projection all the records / values present in a particular column are by default selected .

FUNCTIONS

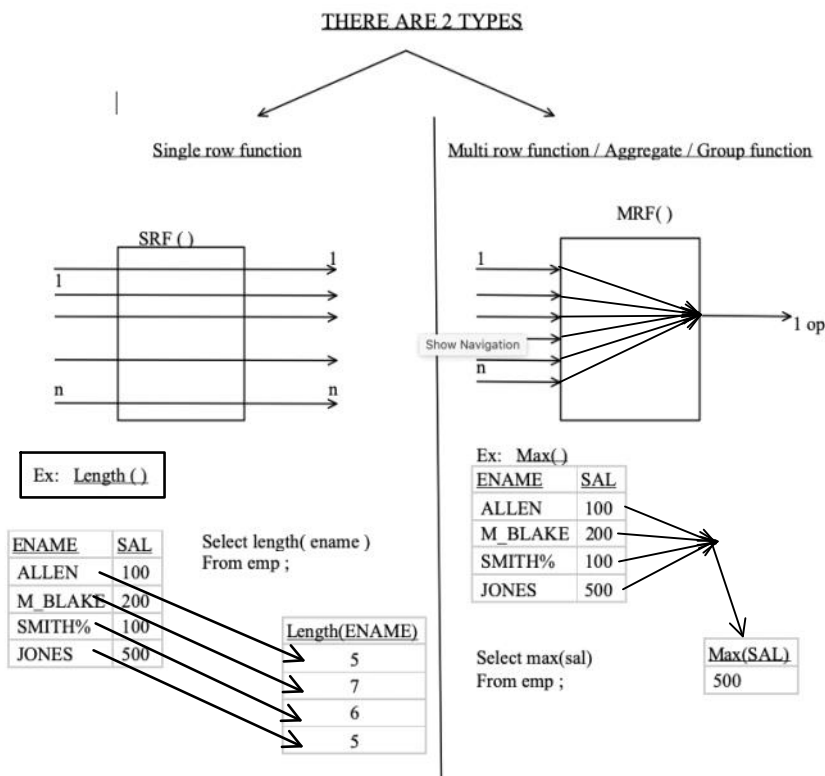

Are a block of code or list of instructions which are used to perform a specific task .

There are 3 main components of a function

1. Function_Name
2. Number_of_arguments (no of inputs)
3. Return type

Types of Functions in SQL :

1. SINGLE ROW FUNCTIONS
2. MULTI ROW FUNCTIONS / AGGREGATE / GROUP FUNCTIONS.

Multi Row Functions:

It takes all the inputs at one shot and then executes and provides A single output .

- If we pass 'n' number of inputs to a MRF() it returns '1' Output .

List of MRF ()

1. **MAX()** : it is used to obtain the maximum value present in the column
2. **MIN()** : it is used to obtain the minimum value present in the

- column
3. SUM() : it is used to obtain the summation of values present in the column
 4. AVG() : it is used to obtain the average of values present in the column
 5. COUNT() : it is used to obtain the number of values present in the column

NOTE :

- Multi row functions can accept only one argument , i.e a Column_Name or an Expression

MRF (Column_Name / Exp)

- Along with a MRF() we are not supposed to use any other Column_Name in the select clause .
- MRF() ignore the Null .
- We cannot use a MRF() in where clause .
- COUNT() is the only MRF which can accept * as an Argument .

Examples :

1. WAQTD maximum salary given to a manager .

```
SELECT MAX( SAL )
FROM EMP
WHERE JOB ='MANAGER' ;
```

GROUP & FILTERING

GROUPING : GROUP BY Clause

Group by clause is used to *group the records* .

SYNTAX:

```
SELECT group_by_expression / group_function  
FROM table_name  
[WHERE <filter_condition>]  
GROUP BY column_name/expression ;
```

ORDER OF EXECUTION:

```
1-FROM  
2-WHERE(if used) [ROW-BY-ROW]  
3-GROUP BY [ROW-BY-ROW]  
4-SELECT [GROUP-BY-GROUP]
```

EMP

<u>EID</u>	<u>ENAME</u>	<u>SAL</u>	<u>DEPTNO</u>
1	A	100	20
2	B	200	10
3	C	300	30
4	D	100	10
5	E	200	10
6	A	400	30
7	C	500	20
8	F	200	30

Example :

- WAQTD number of employees working in each dept .

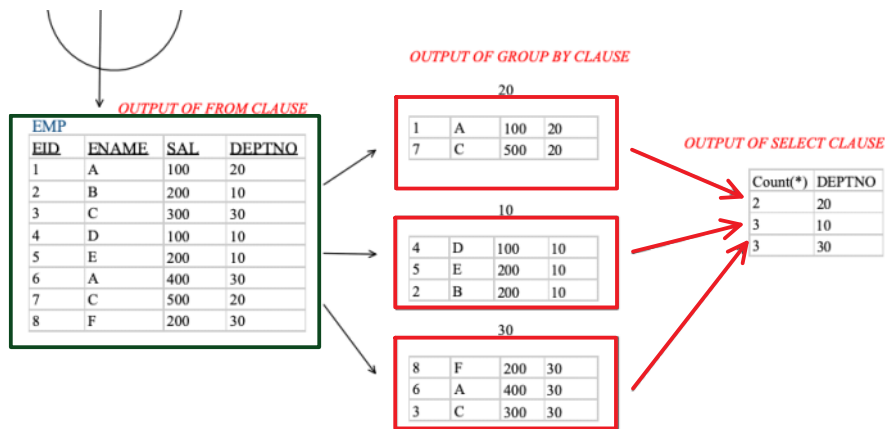

```
SELECT COUNT(*)  
FROM EMP  
GROUP BY DEPTNO ;
```

```
Select count(*) , DEPTNO  
From emp  
Group by deptno;
```

OUTPUT OF GROUP BY CLAUSE

20

NOTE :

- Group By clause is used to group the records .
- Group By clause executes row by row .
- After the execution of Group By clause we get Groups .
- Therefore any clause that executes after group by must execute Group By Group .
- The Column_Name or expression used for grouping can be used In select clause .
- Group By clause can be used without using Where clause .

Questions :

1. WAQTD number of employees working in each dept except the Employee working as analyst .

```

WHERE JOB NOT IN 'ANALYST'
GROUP BY DEPTNO ;
```

2. WAQTD maximum salary given to each job .

```
SELECT JOB , MAX( SAL )
FROM EMP
GROUP BY JOB ;
```

3. WAQTD number of employees working in each job if the employees Have character 'A' in their names .

```
SELECT JOB , COUNT(*)
FROM EMP
WHERE ENAME LIKE '%A%'
GROUP BY JOB ;
```

4. WAQTD number of employees getting commission in each dept .

SUB-QUERY

" A QUERY WRITTEN INSIDE ANOTHER QUERY IS KNOWN AS SUB QUERY "

Working Principle :

Let us consider two queries Outer Query and Inner Query .

- Inner Query executes first and produces an Output .
- The Output of Inner Query is given / fed as an Input to Outer Query .
- The Outer Query generates the Result.
- Therefore we can state that 'the Outer Query is dependent on Inner Query' and this is the Execution Principle of Sub Query .

Why / When Do we use SUB QUERY :

Case 1 : Whenever we have Unknowns present in the Question We use sub query to find the Unknown .

Example :

EMP

EID	ENAME	SAL	DEPTNO
1	ALLEN	1000	20
2	BLAKE	2000	10
3	CLARK	3000	30
4	MILLER	1500	10
5	SMITH	2500	10

FROM EMP
```

WHERE SAL > 2500 ;

2. WAQTD names of the employees earning less than MILLER .

```
SELECT ENAME

DAY 13

Monday, August 3, 2020 9:47 AM

TYPES OF SUB - QUERY :

1. SINGLE ROW SUB QUERY
2. MULTI ROW SUB QUERY

Example :

Emp

EID	ENAME	SAL	DEPTNO
1	ALLEN	1000	20
2	BLAKE	2000	10
3	CLARK	3000	30
4	MILLER	1500	10
5	SMITH	2500	10

DEPT

DEPTNO	DNAME	LOC
10	D1	L1
20	D2	L2
30	D3	L3

1. WAQTD dname of ALLEN .

```
SELECT DNAME
FROM DEPT
WHERE DEPTNO = ( SELECT DEPTNO
                  FROM EMP
                  WHERE ENAME = 'ALLEN' );
```

20

2. WAQTD dnames of allen and smith .

```
SELECT DNAME
FROM DEPT
WHERE DEPTNO = ( SELECT DEPTNO
                  FROM EMP
                  WHERE ENAME IN
                    ( 'ALLEN' , 'SMITH' ) );
```

DEPTNO
20
10
30
10

Here , since the sub query returns 2 records we cannot use '=' Op . We've to use IN Op .

1. SINGLE ROW SUB QUERY :

- If the sub query returns exactly 1 record / value we call it as Single Row Sub Query .
- If it returns only 1 value then we can use the normal operators Or the Special Operators to compare the values .

2. MULTI ROW SUB QUERY :

- If the sub query returns more than 1 record / value we call it as Multi Row Sub Query .
- If it returns more than 1 value then we **cannot use the normal operators** We have to **use only Special Operators** to compare the values .

Note : It is difficult to identify whether a query Belongs Single or Multi row So , it is always recommended to use Special Operators to Compare The values .

1. WAQTD ename and salary of the employees earning *more than* Employees of dept 10 .

EID	ENAME	SAL	DEPTNO
1	ALLEN	1000	20
2	BLAKE	2000	10
3	CLARK	3000	30
4	MILLER	1500	10
5	SMITH	2500	10

SELECT ENAME , SAL
FROM EMP
WHERE SAL

>

(SELECT SAL
FROM EMP
WHERE DEPTNO = 10) ;

Here we cannot use > symbol to compare Multiple values .

We cant use IN or. NOT IN as well because It is used for = and != symbols .

Therefore we have to use Sub Query Operators For Comparing Relational Operators such as (> , < , >= , <=) .

Sub Query Operators :

1. ALL :

"It is special Op used along with a relational Op (> , < , >= , <=) to compare the values present at the RHS "

- ALL Op returns true if all the values at the RHS have satisfied the condition .

Example :

CLARK 3000

2000

Example :

CLARK ,3000

2000
1500
2500

SELECT ENAME , SAL
FROM EMP
WHERE SAL > ALL (SELECT SAL
FROM EMP
WHERE DEPTNO = 10) ;

1000 > 1500	False
1000 > 2500	False

2000 > ALL (2000 , 1500 , 2500)

2000 > 2000	False
2000 > 1500	True
2000 > 2500	False

3000 > ALL (2000 , 1500 , 2500)

3000 > 2000	True
3000 > 1500	True
3000 > 2500	True

1500 > ALL (2000 , 1500 , 2500)

1500 > 2000	False
1500 > 1500	False
1500 > 2500	False

2500 > ALL (2000 , 1500 , 2500)

2500 > 2000	True
2500 > 1500	True
2500 > 2500	False

2. ANY :

"It is special Op used along with a relational Op (> , < , > = , < =) to compare the values present at the RHS ".

- ANY Op returns true if one of the values at the RHS have satisfied the condition .

Example :

SELECT ENAME , SAL
FROM EMP
WHERE SAL

> ANY

(SELECT SAL
FROM EMP
WHERE DEPTNO = 10) ;

2000
1500
2500

1500 > 1500	False
1500 > 2500	False

2500 > ANY (2000 , 1500 , 2500)

JOINS

"The process of retrieval of data from multiple tables simultaneously is known as JOINS "

WHY ? WHEN ?

Whenever the attributes is to be selected from both the tables we use Joins

Types of JOINS .

We have 5 types of joins

1. CARTESIAN JOIN / CROSS JOIN
2. INNER JOIN / EQUI JOIN
3. OUTER JOIN
 - i. LEFT OUTER JOIN
 - ii. RIGHT OUTER JOIN
 - iii. FULL OUTER JOIN
4. SELF JOIN
5. NATURAL JOIN .

1. CARTESIAN JOIN / CROSS JOIN :

In Cartesian Join a record from table 1 will be merged with All the records of table 2 .

1. WAQTD ename and dept name for all the employees .

```
SELECT ENAME , DNAME
FROM EMP , DEPT ;
```

```
SELECT ENAME , DNAME
FROM EMP CROSS JOIN DEPT ;
```

2. INNER JOIN :

"It is used to Obtain only Matching Records "
Or " A records which has a Pair " .

JOIN Condition : It is a condition on which the two tables
 Are merged .

Syntax: Table_Name1.Col_Name = Table_Name2.Col_Name

Join Condition : **EMP.DEPTNO = DEPT.DEPTNO**

20 = 10	False	30 = 10	False	10 = 10	True
20 = 20	True	30 = 20	False	10 = 20	False
20 = 30	False	30 = 30	True	10 = 30	False

Result Table :

<u>ENAME</u>	<u>EMP.DEPTNO</u>	<u>DNAME</u>	<u>DEPT.DEPTNO</u>
A	20	D2	20
B	30	D3	30
C	10	D1	10

SYNTAX:

CO - RELATED SUB QUERY

" A query written inside another query such that the outer query and the inner query are Dependent on each other , this is known as Co-Related Sub-Query " .

WORKING PRINCIPLE :

Let us consider two queries inner and outer query respectively ,

1. Outer query executes first but partially
2. The partially executed output is given as an input to the inner Query
3. The inner query executes completely and generates an output
4. The output of inner query is fed as an input to the Outer query and Outer Query produces the result .
5. Therefore, we can state that the outer query and the inner query both are INTERDEPENDENT (dependent on each other) .

NOTE :

- i. In co-related sub query a Join condition is a must , And must be written only in the Inner Query .
- ii. Co-Related sub query works with the principles of both SUB QUERY & JOINS .

DIFFERENCE BETWEEN SUB QUERY AND CO RELATED SUB QUERY .

<u>SUB QUERY</u>	<u>CO-RELATED SUB QUERY</u>
Inner query executes first	Outer query executes first
Outer query is dependent on inner query	Both are interdependent

Join condition not mandatory	Join condition is mandatory and must be written in inner query
Outer query executes Once	Outer query executes Twice .

STATEMENTS ARE CLASSIFIED INTO 5 DIFFERENT TYPES

- DATA DEFINITION LANGUAGE (DDL)
- DATA MANIPULATION LANGUAGE (DML)
- TRANSACTION CONTROL LANGUAGE (TCL)
- DATA CONTROL LANGUAGE (DCL)
- DATA QUERY LANGUAGE (DQL)

1. DATA DEFINITION LANGUAGE (DDL):

" DDL is used to construct an object in the database and deals with the Structure of the Object "

It has 5 statements :

1. CREATE
2. RENAME
3. ALTER
4. TRUNCATE
5. DROP

1. CREATE : " IT IS USED TO BUILD / CONSTRUCT AN OBJECT "

Object / Entity can be a Table or a View (Virtual Table) .

How to Create a Table :

- Name of the table
 - ▶ Tables cannot have same names .
- Number of Columns .
- Names of the columns .
- Assign datatypes for the Columns.
- Assign Constraints [**NOT MANDATORY**] .

Example 1:

Table_Name : **CUSTOMER**

Number of Columns : **4**

Customer

Column_Name	CID	CNAME	CNO	ADDRESS
Datatypes	Number(2)	Varchar(10)	Number (10)	Varchar(15)
Null / Not Null	Not Null	Not Null	Not Null	Null
Unique	Unique		Unique	
Check			Check (length(CNO) = 10)	
Primary Key	Primary Key			

Check		Check (length(CNO) = 10)	
Primary Key	Primary Key		
Foreign Key			

Not Mandatory

Syntax to create a table :

```
CREATE TABLE Table_Name
(
    Column_Name1 datatype constraint_type ,
    Column_Name2 datatype constraint_type ,
    Column_Name3 datatype constraint_type ,
    .
    .
    Column_NameN datatype constraint_type
);
```

Example :

```
CREATE TABLE CUSTOMER
(
    CID Number(2) primary key ,
    CNAME Varchar(10) ,
    CNO Number(10) not null check( length( CNO ) = 10 ) ,
    ADDRESS Varchar(15)
);
```

NOTE :

To Describe the table:

Syntax: DESC Table_Name ;

Example 2:

Table_Name : **PRODUCT**
Number of Columns : 4

Product

Column_Name	PID	PNAME	PRICE	CID
Datatypes	Number(2)	Varchar(10)	Number (7,2)	Number(2)

The DML Operations performed on the Database are known as Transactions such as Insertion , Updating and Deletion .

We have 3 Statements :

1. COMMIT

3. SAVEPOINT

1.COMMIT : "This statement is used to SAVE the transactions into the DB ".

Syntax: **COMMIT ;**

➤ UPDATE T1
SET SAL = 1000
WHERE NAME = 'A' ;

<u>NAME</u>	<u>SAL</u>
A	1000
B	200
C	300

➤ **COMMIT ;**

<u>NAME</u>	<u>SAL</u>
A	1000
B	200
C	300

2. ROLLBACK :

This statement is used to Obtain only the saved data from the DB .
It will bring you to the point where you have committed for the last time .

3. SAVEPOINT :

This statement is used to mark the positions or restoration points . (nothing related to DB) .

VALUES('D' , 400) ;
- INSERT INTO T1
VALUES('E' , 500) ;
- **SAVEPOINT S3 ;**
- INSERT INTO T1
VALUES('F' , 600) ;

SYNTAX: ROLLBACK TO Savepoint_Name ;

4. DATA CONTROL LANGUAGE :

"This statement is used to control the flow of data between the users ".

We have 2 statements :

1. GRANT
2. REVOKE

1.GRANT : THIS STATEMENT IS USED TO GIVE PERMISSION TO A USER .

**SYNTAX: GRANT SQL_STATEMENT
ON TABLE_NAME
TO USER_NAME ;**

2.REVOKE : THIS STATEMENT IS USED TO TAKE BACK THE PERMISSION FROM THE USER .

**SYNTAX: REVOKE SQL_STATEMENT
ON TABLE_NAME
FROM USER_NAME ;**

DAY 22

What is Normalization ?

" It is the process of reducing a large table into smaller tables in order to remove redundancies and anomalies by identifying their functional dependencies is known as Normalization . "

Or

"The process of decomposing a large table into smaller table is known as Normalization ."

Or

"Reducing a table to its Normal Form is known as Normalization . "

What is Normal Form ?

A table without redundancies and anomalies are said to be in Normal Form .

Levels of Normal Form .

1. **First Normal Form (1NF)**
2. **Second Normal Form (2NF)**
3. **Third Normal Form (3NF)**
4. **Boyce - Codd Normal Form (BCNF)**

Note : If any Table / entity is reduced to 3NF , then the table is said to be normalized.

1. First Normal Form (1NF) :

- No duplicates records .
- Multivalued data should not be present .

QSPIDERS

<u>QID</u>	<u>NAME</u>	<u>COURSE</u>
1	A	JAVA
2	B	JAVA , SQL
3	C	MT , SQL
1	A	MT

<u>QID</u>	<u>NAME</u>	<u>C1</u>	<u>C2</u>	<u>C3</u>
1	A	JAVA		MT
2	B	JAVA	SQL	
3	C		SQL	MT

2. Second Normal Form (2NF)

- Table should be in 1NF
- Table should not have Partial Functional Dependency .

EMPLOYEE - (EID , ENAME , SAL , DEPTNO , DNAME , LOC)

<u>Eid</u>	<u>ename</u>	<u>sal</u>	<u>Deptno</u>	<u>dname</u>	<u>Loc</u>
1	A	100	10	D1	L1
2	B	120	20	D2	L2
3	C	320	10	D1	L1
4	D	251	10	D1	L1

Eid - ename ,sal

Deptno - dname , loc

$\therefore (\text{Eid} , \text{deptno}) \rightarrow (\text{Ename} , \text{Sal} , \text{Dname} , \text{Loc})$ composite key attribute results in PFD

R1 - (**EID** , ENAME , SAL)

R2 - (**DEPTNO** , DNAME , LOC)

<u>Eid</u>	<u>ename</u>	<u>sal</u>
1	A	100
2	B	120
3	C	320
4	D	251

<u>Deptno</u>	<u>dname</u>	<u>Loc</u>
10	D1	L1
20	D2	L2

3. Third Normal Form (3NF)

- Table should be in 2NF .
- Table should not have Transitive Functional Dependency .

Employee - (**EID** , Ename , Sal , comm , Pin code , state , country)

EID -> ENAME

SAL

COMM

PINCODE -> STATE

COUNTRY

∴ Transitive Functional Dep
